Zooming to Selected Region

To select a dotplot region activate the *Select tool*:

hold down the left mouse button and drag the mouse cursor over the dotplot.

When you select a region on a dotplot the corresponding region is also selected in other *Sequence View* areas (*Sequence details view*, *Sequence zoom view*, etc.).

The opposite is true as well: if you select a region in a *Sequence View* area, the corresponding region is also selected in the dotplot view.

To zoom to the region selected click the *Zoom in* on the left.
