

Installation on Mac OS X

To install UGENE on Mac OS you can use installation package or Disk image file:

Packages for Mac OS X 10.7 and higher:

- Download 64-bit [Universal](#) installer package
- Download 64-bit [Standard](#) or [Full](#) package
- Download 64-bit [NGS](#) package

Note that as the NGS package size is about 4 GB, it is highly recommended to download it using some download management software, for example [Folx](#). Otherwise, if you download it via your web-browser, a short disconnection may cancel the process.

Also, find below UGENE packages for old Mac OS X versions. Note, that they updated from time to time (not in each release).

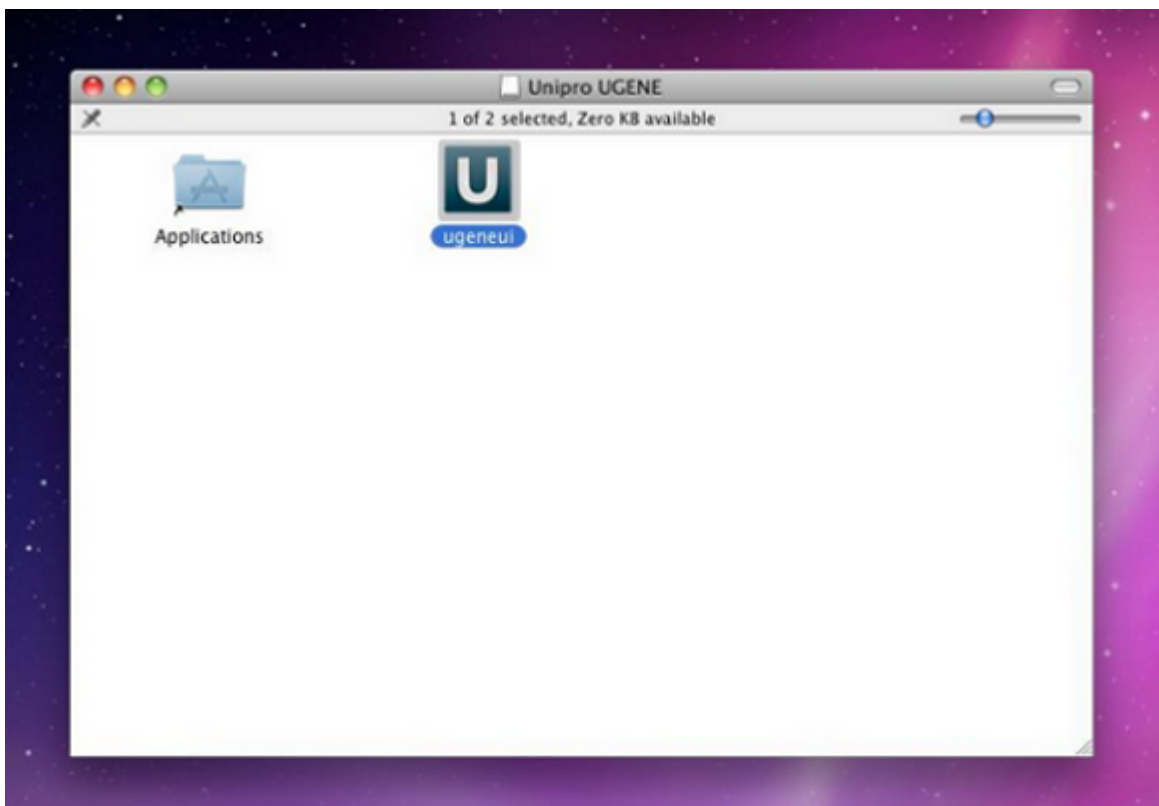

- *PowerPC*: the latest available version is 1.10.3 ([download](#)).
- *Mac OS X 10.4 Tiger (Intel)*: the latest available version is 1.10.3 ([download](#)).

To use this version one should [download](#) and install Qt first.

- *Mac OS X 10.5*: the latest available version is 1.18.0 (download [Standard](#) or [Full](#) 32-bit package).
- *Mac OS X 10.6*: the latest available version is 1.18.0 (download [Standard](#) or [Full](#) 64-bit package).

Please [contact us](#) if you're interested in obtaining the latest version of one of these packages.

- Launch the universal installer package and follow the Unipro Setup wizard.
- Also you can launch *.dmg file and accept the GNU license agreement. The following window will appear:

- To start UGENE click on the ugeneui icon. You can also copy UGENE to the Applications folder by dragging it.
