

Installation on Linux

The following UGENE package delivery types are available on Linux:

- **Online installer:** updates to new versions are supported
- **TAR.GZ archive:** does not require Internet connection to be installed
- **Native installation:** available for Ubuntu and Fedora only, provides closer integration with the operating systems, requires administrative rights

Download links for the online installers and TAR.GZ archives are available on the "[Download UGENE and components](#)" page. Be careful to select a link for correct platform (64-bit or 32-bit).

Information about native installation on Ubuntu and Fedora is provided below.

Installation using online installer

- Download the online installer file for your platform (64-bit or 32-bit).
- Make the file executable - in the Terminal run "`chmod +x installer_file_name`".
- Execute the file: "`./installer_file_name`". For example:

```
cd ~/Downloads
chmod +x ugeneInstaller_64bit
./ugeneInstaller_64bit
```

- Follow the installation wizard.

On a new UGENE version release, a notification will appear with an option to update the package.

Installation using TAR.GZ archive

- Download the required TAR.GZ archive. Choose [Standard, Full, or NGS package](#) for your platform (64-bit or 32-bit). Note that the NGS package is available for 64-bit platform only.
- Unpack the archive - in the Terminal run "`tar -xf archive_file`".
- From the unpacked folder run "`./ugene -ui`" (here "ui" states for "User Interface"). For example:

```
cd ~/Downloads
tar -xf ugene-current-version-x86-64.tar.gz
cd ugene-current-version
./ugene -ui
```

On a new UGENE version release, a notification will appear. However, to install the new version, it is required to manually download the package again.
