## **Translating Nucleotide Sequence**

When a nucleotide sequence is opened in the Sequence View, the sequence and its complementary sequence are shown by default in the Details View.

## Showing/hiding the amino acid sequences

It is possible to translate them and show also the corresponding amino acid sequences:

The translation settings are available on the left toolbar of the Details View:

The Show/hide amino acid translations menu allows one to set up the mode of the amino acid sequences visualization:

The following options are available:

- · Do not translate— hide the amino acid sequences.
- Translate selection translate only a selected region of the sequence and the complementary sequence.

• Set up frames manually — select the reading frames to show. There are three frames for the sequence ("+1", "+2", "+3") and three frames for the complementary sequence ("-1", "-2", "-3"). Note that the complementary frame items are hidden in the menu, if the complementary sequence is hidden.

• Show all frames — show all amino acid sequences.

## Setting the genetic code

The default value for the genetic code for a nucleotide sequence translation is read by UGENE from the sequence file when it is available. One can also set up the genetic code for the sequence using the *Select genetic code* menu:

T <sub>L</sub>	1. The Standard Genetic Code							
0	2. The Vertebrate Mitochondrial Code							
	3. The Yeast Mitochondrial Code							
	4. The Mold, Protozoan, and Coelenterate Mitochondria and the Mycoplasma Code							
	5. The Invertebrate Mitochondrial Code							
	6. The Ciliate, Dasycladacean and Hexamita Nuclear Code							
	9. The Echinoderm and Flatworm Mitochondrial Code							
	10. The Euplotid Nuclear Code							
	11. The Bacterial and Plant Plastid Code							
	12. The Alternative Yeast Nuclear Code							
	13. The Ascidian Mitochondrial Code							
	14. The Alternative Flatworm Mitochondrial Code							
	15. Blepharisma Nuclear Code							
	16. Chlorophycean Mitochondrial Code							
	21. Trematode Mitochondrial Code							
	22. Scenedesmus obliquus Mitochondrial Code							
	23. Thraustochytrium Mitochondrial Code							

(1) All analysis routines (like HMMER, ORF finding, etc.) will use this code by default.

## Codon table

To refresh the knowledge about the amino acid codes, select the Show codon table button appears at the upper part of the window:

1 ct baca	2nd base								
TSC Dase	U		С		A		G		Silu Dase
	UUU	<u>Phenylalanine (Phe, F)</u>	UCU	<u>Serine (Ser, S)</u>	UAU	<u>Tyrosine (Tyr, Y)</u>	UGU	JGU JGC <u>Cysteine (Cys, C)</u>	U
	UUC		UCC		UAC		UGC		С
