

Build CLARK Database

Build a CLARK database from a set of reference sequences ("targets"). NCBI taxonomy data are used to map the accession number found in each reference sequence to its taxonomy ID.

Element type: clark-build

Parameters

Parameter	Description	Default value	Parameter in Workflow File	Type
Database	A folder that should be used to store the database files.		database	string
Genomic library	Genomes that should be used to build the database ("targets"). The genomes should be specified in FASTA format. There should be one FASTA file per reference sequence. A sequence header must contain an accession number (i.e., >accession.number ... or >gi number ref accession.number ...).		taxonomy	url-datasets
Taxonomy rank	Set the taxonomy rank for the database. CLARK classifies metagenomic samples by using only one taxonomy rank. So as a general rule, consider first the genus or species rank, then if a high proportion of reads cannot be classified, reset your targets definition at a higher taxonomy rank (e.g., family or phylum).	Species	taxonomy-rank	number

Input/Output Ports

The element has 1 *output port*:

Name in GUI: Output CLARK database

Name in Workflow File: out

Slots:

SlotInGUI	Slot in Workflow File	Type
Output URL	url	string
