

In Silico PCR

In Silico PCR Overview

In silico PCR is used to calculate theoretical polymerase chain reaction (PCR) results using a given set of primers (probes) to amplify DNA sequences.

UGENE provides the In silico PCR feature only for nucleic sequences with Standard DNA and Extended DNA alphabets. To use it in UGENE open a DNA sequence and go to the *In silico PCR* tab of the Options Panel:

In Silico PCR

▼ Forward primer

GCCGGGCATGGTGGCGCAC

Tm = 69.84°C, 19-mer

Mismatches 0 bp

▼ Reverse primer

GGGCTGGAGAGATGGCTCA

Tm = 61.07°C, 19-mer

Mismatches 0 bp

▼ Settings

3' perfect match 15 bp

Maximum product size 5000 bp

Use ambiguous bases ☒

Extract annotations Inner

► Melting temperature

[Show primers details](#)

Warning: forward primer has high GC-content.

Find product(s) anyway

There are the following parameters:

Forward primer - forward primer. The primer length should be between 15 and 50 bases.

Reverse primer - on the opposite strand from the forward primer. The primer length should be between 15 and 50 bases.

Note: you should take in account, that algorithm calculates no more than 50 forward and 50 reverse primers, which means, that you can take 50x50=2500 products maximum.

Mismatches - mismatches limit.

3' perfect match - specify the number of nucleotides at the 3' end that must not have mismatches.

Maximum product size - the maximum size of the amplified sequence. *Use ambiguous bases* - search for ambiguous bases (as \"N\") if checked.

Extract annotations - specify the type of extracted annotations: *Inner*, *All intersected* or *None*.

- Value *Inner* is selected by default. When this value is selected, the extracted PCR product contains annotations from the original sequence, located within the extracted region.
- Value *All intersected* specifies that all annotations of the original sequence that intersect the extracted region must be extracted as well.
- Value *None* specifies that annotations from the original sequence must not be extracted.

Melting temperature - see [the corresponding page](#) for details.

Choosing primers

Type two primers for running In Silico PCR. If the primers pair is invalid for running the PCR process then the warning is shown. Also, primers for the running In silico PCR can be chosen from a [primer library](#). Click the following button to choose a primer from the primers library:

The following dialog will appear:

Name	GC-content (%)	Tm (°C)	Length (bp)	Sequence
Primer	22.22	22	9	AAAAAACGT

The table consists of the following columns: name, GC-content (%), Tm, Length (bp) and sequence. Select primer in the table and click the *Choose* button.

Click the *Reverse-complement* button for making a primer sequence reverse-complement:

In Silico PCR

▼ Forward primer

ACACACGTACTGACAGTCAGCATAACG

T_m = 61.39°C, 28-mer

Click *Show primers details* for seeing [statistic details](#) about primers.

When you run the process, the predicted PCR products appear in the products table.

Melting temperature

Click the [Melting temperature](#) link for choosing temperature calculation algorithm: Rough or Primer 3.

More information about the temperature options see here: [Melting temperature](#)

Products table

There are three columns in the table:

- region of product in the sequence
- product length
- preferred annealing temperature

Click the product for navigating to its region in the sequence.

Click the *Extract product(s)* button for exporting a product(s) in a file or use double click for that.

Region	Length	T _a
60822 - 63999	3178	58.56
